A. Status: nucleic acid sequence not shown
A. Molecule type: mRNA
A. Rolecule type: mRNA
A. Residues: 1-15, 'C', 17-30, 'L', 32, 'K', 34-83, 'Y', 85-176, 'K', 178-206, 'L', 208-333, 342-418
C. Comment: This protein is an arrestin homolog which acts analogously to desensitize the C. Superfamily: arrestin
C. Superfamily: arrestin
E;1-418/Product: beta-arrestin, brain #status predicted <MAT>
F;1-33,342-418/Product: beta-arrestin, lung #status predicted <MAZ>

               plexiform regions of the retina.
PTM: Phosphorylated upon light exposure.
SIMILARITY: Belongs to the arrestin family.
                                                      transduction.
TISSUE SPECIFICITY: Inner and plexiform regions of the retir
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 K.H., Doyle

"Mechanism of arrestin 2 function in rhabdomeric photoreceptors.
J. Biol. Chem. 269:26969-26975 (1994).
-!- FUNCTION: Directly interacts with light-activated rhodopsin.
the dephosphorylation of metarhodopsin. Interacts the dephosphorylation of metarhodopsin. Interacts of the arrestin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      irect protein sequencing; Phosphorylation; Sensory transduction;

RESULT 1 ABP52833 ID P52833 nopheles gambiae; odourant receptor; 26-JAN-2001; 24-JAN-2002; Anopheles gambiae arrestin 1 01-NOV-2002 (first entry) ABP52833; ABP52833 standard; protein; Zwiebel LJ; 28-JAN-2002; 2002WO-US002549 01-AUG-2002. WO200259274-A2. Anopheles gambiae. (UYVA-) UNIV VANDERBILT. 2001US-0264649P. 2002US-00056405. mosquito; olfactory gene; arrestin 1; pest control; olfaction. 383 protein SEQ ID ጅ NO: 2

The present invention describes a purified Anopheles gambiae olfaction polypeptide comprising a 383, 394, 380, 411, 412, 391, 157 or 401 residue amino acid sequence (see ABP52833 to ABP52840) (S1), a conservatively modified amino acid sequence of them, or a sequence of (S1) with at least 20 consecutive residues. Also described: (1) an isolated polynucleotide comprising: (a) a nucleotide sequence encoding the purified Anopheles gambiae olfaction polypeptide; or (b) a nucleotide sequence that hybridises under stringent conditions to a hybridisation probe comprising a 1964, 1239, 1142, 1236, 1194, 1176, 474 or 1206 nucleotide sequence (see AB075102 to AB075105 and AB075110 to AB075113) (S2), or its complement; and (2) a method for identifying an agent that binds to

New mosquito olfaction polypeptides and polynucleotides, useful for mosquito management, i.e. controlling the pest and disease vectors, for identifying pest control agents.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins (ABL5777-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a polynucleotide for preventing, treating or diagnosing a disease in an individual. The composition or the polypeptide, polynucleotide or RNA precursor, or antibody is useful for diagnosing, preventing or treating diseases (e.g. cell proliferative diseases such as cancer) in an individual. These may also be used for identifying substances capable of binding to or modulating the function of the polypeptide, capable of affecting the function of the corresponding gene, or capable of inhibiting the cell division cycle or cell cycle progression, preferably mitosis and/or meiosis. The present sequence represents an antagonist of cell cycle progression protein
                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New cell cycle progression genes and proteins for modulating cell cycle progression in cells, for preventing, treating or diagnosing cell proliferative diseases (e.g. cancer) or for identifying modulators of

The present sequence is the protein sequence of arrestin 2, a novel comparity olfaction molecule. The invention provides 9 novel mosquito and odorant receptor molecules 1-7. The odorant receptor molecules 1-7. The odorant receptors function comparity of a ligand-induced signal transduction pathway for the activation of the molecules 1-7. The odorant receptors function of and arrestin as an 'off; switch for the odorant receptors act as an 'on' switch compounds that modulate arrestin 2 dentifying compounds that interfere compounds that modulate arrestin 2 activity. These are useful for the control of mosquitoes, particularly by reducing their ability to locate the outcase of bloodmeal.
                                                                                                                                                                                 Query Match

                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention insecticides interactions in higher eukaryotes for the development of discloses genomic DNA sequences (ABL01840-ABL16175) and pharmaceutical drugs. The invention sequences (ABL01840-ABL16175) and the encoded proteins (appressed DNA BP27072). The sequence data for this patent did not form part of the from WIPO at ftp.wipo.int/pub/published_pct_sequences (ABB73737-from WIPO at ftp.wipo.int/pub/published_pct_sequences format directly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best Local Similarity
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and coll-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57377-ABB72072). The sequence data for this patent did not form part of the

AAG67780 standard; protein; 410 AA.

AAG67780;

10-DEC-2001 (first entry)

Amino acid sequence of human beta-arrestin 1B.

Arrestin; phosphorylation-independent arrestin mutant;
G protein-coupled receptor; GPCR; GPCR ligand; retinitis pigmentosa; stationary night blindness; colour blindness; nephrogenic DI; isolated glucocorticoid deficiency; hyperfunctioning thyroid adenoma; familial hypocalciuric hypercalcemia; hyperparathyroidism; neurological disorder.

Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents an arrestin protein. The specification describes phosphorylation-independent arrestin mutants. These mutants are content of the sequence of the comprises contacting assays to identify ligands and/or modulators of G CC constitutively active arrestin mutant with a test compound; and a GCC constitutively active arrestin mutant with a test compound; and a contential ligand the ability of the test compound to modulate binding of CC the test compound is a GPCR ligand. The method is used for identifying a GPCR ligand. The method is used for identifying CC treating patients having e.g. retinitis pigmentosa, stationary night contents, hyperfunctioning thyroid adenomas, familial hypocalciuric for uses as human therapeutics. Modulators of GPCR may be used for CC deficiency, hyperfunctioning thyroid adenomas, stationary night contents, the content of the sequence of the compound to hypercalcemia, hyperparathyroidism and neurological disorders. The methods may be used for screening pluralities of test compounds (e.g. a CC identification of natural and surrogate agonists of orphan GPCRs, and for CC identification of GPCR antagonists and/or agonists

The invention relates to a complex of protein-protein interactions (forming a protein-protein interaction map, PIM) in adipocyte cells as defined in the specification, or polynucleotides in adipocytes encoding for the polypeptides. Also included are a recombinant cell expressing the interacting polypeptides and a method of selecting a modulating compound in adipocyte cells, by cultivating a recombinant host cell on a selective medium containing a modulating compound and a reporter gene the creation of which is toxic for the recombinant host cell which is captression of which is toxic for the recombinant host cell which is creating the modulating observed and a reporter gene the polynucleotide encoding a first hybrid polypeptide and by brinding domain the second vector comprising a polynucleotide encoding a first hybrid polypeptide shinteract and selecting the modulating compound which inhibits the growth of the selecting the modulating compound which inhibits the growth of the complexes are useful for identification compounds that two-hybrid system). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rat; yeast two-hybrid assay; adipocyte; bait protein; NIDDM; non-insulin diabetes mellitus; obesity; selected interacting domain; SID; protein-protein interaction map; PIM; anorectic; metabolic disorder.

The interactions between the proteins of the complex further define a set of selected interacting domains, SID. The present sequence represents a member of the protein complex of the invention, used as the bait protein in the yeast two- hybrid assay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                disorders e.g. non-insulin dependent diabetes mellitus, NIDDM. The compound isolated by the method is useful for treating and preventing obesity or metabolic diseases. The interactions between the proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       protein interactions and useful for treating obesity and metabolic

Claim 7; Page 117-118; 162pp; English.

```
The invention relates to a complex of protein-protein interactions cC between a Shigella flexheri polypeptide (e.g. ospB, ospB, ipaD, ipaC, CC specification. The complexes are formed using the yeast two-hybrid cinteractions between the Shigella flexneri polypeptide defined in the cC interactions between the Shigella flexneri polypeptide and a mammalian polypeptide and a mammalian compound that inhibits or activates the protein-protein interactions, (2) selecting a modulating compound obtained from the method of (2); (4) a SID cc a modulating compound obtained from the method of (2); (4) a SID cc compound the human polypeptides appearing as ABG70042-ABG70242; (5) a containing the vector; and (10) a protein comprising the vector; and (10) a protein comprising the containing the vector; and (10) a protein comprising should be specification. A pharmaceutical composition comprising Shigella cc specification: A pharmaceutical composition comprising Shigella cc shigellosis (bacillary dysentery) in a human or mammal. The present cassay, forming a complex of the invention with a shigella protein hybrid
                                                            Antagonist of cell cycle progression polypeptide #108.
                                                                                                                                                                                                                                                                                                                                                                 246 TAQYKCFVAMEBADD--TVAÞSSTFCKVYTLÍÞFLANNREKRGLÁLÐGKLKHEÐTNLASS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a polynucleotide for preventing, treating or diagnosing a disease in an individual. The composition or the diagnosing, preventing or treating diseases, or antibody is useful for diseases such as cancer) in an individual. These may also be used for of the polypeptide, capable of binding to or modulating the function of the polypeptide, capable of affecting the function of the great or capable of affecting the function of the sequence represents an antagonist of cell cycle progression, preferably mitosis and/or meiosis. The present sequence represents an antagonist of cell cycle progression protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 418 AA;

                                                                                                                                                                          comprises contacting a composition comprising the GPCR and a constitutively active arrestin mutant with a test compound; and contential lity of the test compound to modulate binding of carrestin mutant to the GPCR, where modulation of binding indicates that the test compound is a GPCR ligand. The method is used for identifying potential ligands and/or modulators of GPCRs, particularly modulators, for use as human therapeutics. Modulators of GPCRs, particularly modulators, for use as human therapeutics. Modulators of GPCRs, beta tionary night blindness, colour blindness, nephrogenic DI, isolated glucocorticoid deficiency, hyperfunctioning thyroid adenomes, familial hypocalciuric hypercalcemia, hyperparathyroidism and neurological disorders. The methods may be used for screening pluralities of test compounds (e.g. a small molecule library of compounds) or a composition containing a colourality of GPCRs. The methods may be used in screening assays for identification of natural and surrogate agonists of orphan GPCRs, and for identification of GPCR antagonists and/or agonists.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    describes phosphorylation-independent arrestin mutants. These mutar used in screening assays to identify ligands and/or modulators of c protein-coupled receptors (GPCRs). A method for identifying a GPCR protein-coupled receptors (GPCRs).
